

● SEEKING ONE SOUTHEAST MICHIGAN PILOT SITE

Raise your colorectal cancer screening completion rate — a measure you already report

A 12-month, low-burden pilot that runs inside your existing staffing and improves the UDS number your center is already judged on.

WHY THIS MEASURE

Colorectal cancer screening (adults 45–75, USPSTF Grade A) is a clinical quality measure every Health Center Program awardee reports annually on **UDS Table 6B**. HRSA publicly recognizes high performers, and Michigan Medicaid’s HEDIS-based incentive programs attach real dollars to the same measure. The national rate is 63.5% against a 72.8% Healthy People 2030 target — which means demonstrable headroom for most centers.

WHAT THE PILOT DOES

A behaviorally sequenced completion loop, configured with your team:

- ✓ **Identify** — overdue patients flagged from your EHR (standards-based, HL7® FHIR®)
- ✓ **Reduce friction** — mailed FIT kits as the default path; one-click scheduling prompts for staff
- ✓ **Communicate** — reminders tailored by language and literacy level (EN/ES)
- ✓ **Escalate** — non-responders routed to community-health-worker outreach
- ✓ **Measure** — a dashboard shows where patients drop off and which step recovered them

Design discipline: one disease state, one population, one site, one primary outcome — the absolute change in CRC completion against your own historical baseline, with outcome definitions locked in writing before launch. Evaluated with RE-AIM. Secondary outcomes: reminder response, FIT-return conversion, CHW-recovered completions, patient experience, and cost per additional completed screening.

Burden: runs primarily within existing staffing; CHW outreach is reserved for high-risk non-responders. Every lever is CDC Community Guide-recommended — nothing experimental is done to patients.

IS YOUR CENTER A FIT?

- ✓ Reported CRC screening rate below the Healthy People 2030 target on your UDS submission
- ✓ An EHR with standards-based (FHIR®) data access
- ✓ An existing or planned community-health-worker or outreach function
- ✓ Leadership willing to name a quality-improvement sponsor

THE ASK

A 45-minute exploratory conversation. If there’s mutual fit, Phase 0 is a 90-day partnership definition ending in a signed MOU — data access, staffing roles, and locked outcome definitions — before anything touches a patient workflow. All data exchange occurs within your HIPAA-compliant environment under appropriate agreements; evaluation reporting uses de-identified, aggregate data only.
