

The screening exists. Completion is what's missing.

A partnership brief on closing the gap between preventive care that is offered and preventive care that is actually completed — across Bangladesh's community-clinic screening system.

Bangladesh's community-clinic screening program has national reach and a registry — yet reports low uptake and loss to follow-up. That is a completion-and-fidelity gap, not a science gap. The Prevention Adoption Initiative is a disease-agnostic engine that finds who is overdue, removes friction, and drives completion, with an explainable dashboard. I am looking for a first partner to pilot it and scale it.

THE PROBLEM — ADOPTION, NOT SCIENCE

69%

of health spending is out-of-pocket (WHO, 2025) — one hospitalization can push a household into poverty.

<1% of GDP

public health spending (World Bank, 2021) — prevention is under-resourced.

Reach, low uptake

the national cervical & breast screening program has reach and a registry, but reports low uptake and loss to follow-up.

THE APPROACH — FOUR PILLARS, ONE COMPLETION LOOP

Service redesign & friction reduction

Make the completed path the easiest one — defaults, mailed at-home tests, one-click scheduling.

Behaviorally-configured data infrastructure

Registries + dashboards that surface who is overdue and where patients drop out; automated reminders.

Applied AI, explainable

A proposed model layer that flags likely drop-offs and prioritizes outreach — fairness-audited, human-in-the-loop.

Implementation enablement

Training so a site can run and sustain the toolkit itself — the pillar the evidence says matters most.

Identify → **Reduce friction** → **Communicate** (literacy-tailored) → **Escalate** (community-health-worker outreach) → **Measure**, incl. diagnostic follow-up after a positive result.

THE DEMONSTRATION

Embed the completion loop into a program that already exists.

Rather than build something new, the engine embeds into the existing network of roughly 14,000 community clinics and the national electronic registry — piloted in a few upazilas, aligned to the national NCD and screening strategy — to close the uptake and follow-up gaps the program's own evaluation identifies. Disease-agnostic by design: the same loop applies to cervical and breast screening, hypertension, and immunizations.

THE ASK

Different partners, different value — the same completion engine.

Private healthcare

Where completion is also good business — more screenings, more diagnostics, stronger payer & corporate-wellness contracts.

Government

Strengthen a program that exists — DGHS NCDC and the Community Clinic Health Support Trust, piloted in a few upazilas.

Research & NGO

icddr, b, BRAC, Marie Stopes — publishable, scalable evidence that opens donor funding.
